Professional Summary

"Motivated and adaptable Software Developer with over 2+ years of experience in building and maintaining robust applications, specializing in Ruby on Rails. I thrive in agile, cross-brand environments where collaboration and continuous learning are key. Experienced in working closely with architects, designers, and analysts to deliver high-quality solutions that drive collaboration within large organizations. Eager to contribute to innovative projects that enhance connectivity and efficiency across the Traton family."

If you're looking for a dedicated and reliable developer to bring your vision to life, let's connect! also, meet me here <http://burraq.info>

Education

- Bachelors in Information Technology (University of Education(UOE), Batch 2017-21)

Skills

- Rails
- Rails API implementation
- Docker
- Sidekick
- Heroku deployment
- Javascript (Also, Angular JS & React JS)
- JQuery, Typescript
- Html/CSS
- Bootstrap, Ajax, Tailwind
- Git, GitHub, Bitbucket, CI/CD & DevOps
- Deployment and some services of AWS(S3, EC2, RDS, Alarming)
- Scrum master
- Jira task manager
- Cross-Brand Collaboration
- Agile Development
- API Integration & Data Management
- AWS services and external data scraping.
- Multilingual Project Support

Certifications & Training

- Agile Development with Scrum & SAFe Frameworks
- AWS Certified Developer – Associate
- JavaScript Frameworks: AngularJS & ReactJS

Experience

November 2022 - Present

Xprolabs – Ruby On Rails Developer

- Developed and maintained multiple in-house modules, focusing on cross-brand collaboration within the Traton family.
- Collaborated closely with solution architects, UX designers, and systems analysts to ensure applications meet shared goals and adhere to best practices.
- Enhanced application scalability and performance, contributing to increased collaboration between Traton brands like MAN and Navistar.

- Implemented CI/CD pipelines and automated testing frameworks to streamline deployment and ensure consistent quality.
- Led the development of multilingual support features, improving accessibility and user experience across different regions.
- Developed multiple modules for in-house products.
- Key responsibilities included creating complete modules, communicating with clients, and customizing the core product based on client requirements.
- Understood client requirements and provided simple, efficient, and practical solutions to meet those requirements.
- Collaborated with cross-functional teams to integrate new features
- Conducted thorough testing and debugging to ensure software quality.
- Provided technical support and troubleshooting for existing applications. And documented development processes
- Continuously evaluated and improved the performance and scalability of applications

Projects

Career Camp:

- Developed an e-learning system designed to assist individuals in acquiring the necessary skills and knowledge for specific careers, ultimately helping them secure employment.
- Created complex modules within the system, such as implementing dynamic event creation categorized by specific topics. Utilized AJAX to enhance the user experience and provide real-time updates.
- Took responsibility for managing the entire app development process, including client communication, requirement gathering, and coordinating with the development teams.
- An Admin panel to manage data from the admin side and create records for end users.
- The application is deployed into AWS, ensuring reliable and scalable hosting for seamless access and utilization.
- Implemented new sprint work according to client requirements, enhancing various sections such as new courses, students, tutors, and employers.

Kinari:

- Added a new feature to an existing app that allows storing surveys for specific customers and supporting translations for questions and their choices in multiple languages.
- By providing this feature, the app becomes more inclusive and accessible to users who speak different languages, enhancing the overall user experience and usability.
- The functionality includes:
 - Storing surveys: Implemented the ability to create and store surveys within the app. This allows administrators or users to define and customize surveys based on their specific needs.
 - Multilingual support: Integrated the capability to store translations for survey questions and their choices in multiple languages. This ensures that the app can accommodate users from different regions or language preferences.
 - Dynamic translations: Designed the system to allow for dynamic translations, enabling administrators or users to easily add or update translations for survey elements without requiring code changes.
 - Language selection: Implemented a feature that allows users to select their preferred language for viewing and interacting with the surveys. This ensures a personalized experience for users based on their language preferences.
 - Upload CSV file for saving the survey record in bulk and the same as it for downloading the survey in the CSV format
- Developing and fixing bugs for the survey builder, implementing backend functionality to add surveys, validating responses, and displaying results in graphs. Features include user impersonation through the admin panel, sending SMS and WhatsApp messages, implementing background jobs for

scheduled tasks, creating multi-step forms, and generating URL-based surveys.

Supply Chain Management System:

- Developed a project from scratch, building comprehensive business logic and designing the application architecture.
- Implemented multi-profile login functionality using Devise, allowing both manufacturers and buyers to create and manage their profiles.
- Enabled manufacturers and buyers to add and view reviews on profiles, facilitating user feedback and interaction.
- Introduced subscription plans, offering premium, standard, and basic options to cater users needs.
- Integrated an e-commerce store, providing users with access to various services.
- Scraped external sites to gather data on manufacturers, enhancing the database content.
- Deployed the entire site on AWS, utilizing S3 for file storage and RDS for the database, ensuring reliable and scalable infrastructure.

Clinical Scribe:

- Voice to Clinical Notes Conversion: Implement a feature that converts spoken words into written clinical notes, allowing doctors to dictate their observations and treatments.
-
- Dictation Capability for Clinical Notes: Allow doctors to add clinical notes using dictation, enabling hands-free note-taking and improving efficiency during patient consultations.
-
- Task Management: Integrate a task management system to help doctors and clinic staff track and manage their tasks and to-dos, ensuring nothing is overlooked.
-
- Doctor Profiles: Create detailed profiles for doctors, including their specialties, experience, and contact information, making it easier for patients to find and connect with the right doctor.
-
- Patient Profiles: Develop comprehensive patient profiles that include medical history, current medications, and previous appointments, providing doctors with all the necessary information at a glance.
-
- Online Appointments: Enable doctors to conduct online appointments through the app, facilitating remote consultations and expanding access to medical care for patients.

Invoke:

- Developed a comprehensive company portal with a user-friendly interface allowing management of roles and permissions for each specific role.
- Implemented various gems and modules to provide extensive functionality and usefulness for any company's needs.
- Developed a house project for in-house management, and made employees in record.
- Tax calculation, Salary slips, Salary calculation, Time management, Attendance Record, Apply leaves via portal, Leave's records etc

Shopify App:

- Developed an application that integrates with the Shopify platform, allowing fetching of products from external sources and adding them to the Shopify app.

Easy Translations:

- Implement user authentication. Allow authenticated users to create their own projects. Upload file functionality to allow users to upload the en.yml file for their project.
- Utilize a translation service or API (**such as DeepL or Chat GPT**) to translate the uploaded en.yml file into the selected language(s).

- Use a background job processing framework like Sidekiq or Delayed Job to handle the translation process in the background. This ensures that the user does not have to wait for the translation to complete and can continue using the application.
- Store the translated versions of the en.yml file in the database, associating them with the respective user's project. also, provide the ability to view and download the translated en.yml file for a specific language within the user's project.
- Implement proper access control to ensure that users can only access and download the translated files for their own projects.

Winad:

- Developed new features based on client requirements, ensuring alignment with their expectations and needs.
- Addressed and resolved UI-related issues by utilizing Haml syntax to enhance and improve the user interface.
- Implemented robust access control mechanisms to ensure users could only access and download translated files pertinent to their respective projects.
- Engaged in effective and continuous client communication to gather detailed task requirements and promptly address any questions or concerns.
- Wrote comprehensive test cases using RSpec for all completed features, ensuring thorough testing and functionality validation.
- Ensured code quality maintenance and adherence to coding standards by employing RuboCop as a specific tool for code analysis and improvement.
- Collaborated with team members to review code and integrate feedback for further refinement.
- Conducted performance testing to identify and mitigate potential bottlenecks in the new features.
- Documented feature implementations and updates for future reference and knowledge sharing within the team.
- Participated in sprint planning and review meetings to provide updates on progress and receive feedback from stakeholders.

Climate API:

- Developed a project focused on the Climate API, which is entirely based on APIs for job listings.
 - Uploaded job listings, including both remote and physical positions, across various IT-related fields.
 - Scraped job listings from different job sites and displayed them in our application.
 - Incorporated job location data, highlighting areas where jobs are available.
 - Implemented filters for searching jobs by name, location, salary range, part-time/full-time status, etc.
 - Ensured the application provides a user-friendly interface for job seekers to find relevant opportunities easily.
-

January 2022 - November 2022

Southville Solutions – Ruby On Rails Developer

- Developed task management and web scraping solutions, contributing to efficient data handling and task tracking for clients.
- Promoted clean coding practices and modular design, ensuring maintainable and scalable solutions.
- Actively engaged in learning and applying new technologies, driving innovation within the team.

Projects

Electask:

- Project seems to be focused on task management or task tracking. It likely provides features to help individuals or teams organize, prioritize, and track their tasks or to-do lists.
- Implementation of a full-calender for managing task-specific dates for users. Users can likely create tasks, assign them to specific categories or projects, set due dates, and add additional details or descriptions for each task.
- Users may be able to track the progress of their tasks, mark them as complete, and receive notifications or reminders for upcoming or overdue tasks.
- This project appears to have a user-friendly interface with a clean and modern design. The website may employ responsive design principles to ensure usability across different devices and screen size

Miketen:

- I developed a comprehensive web scraping model specifically designed to extract data from a Japanese website
- The model successfully scraped the desired data and efficiently stored it in a database.
- The model dynamically adjusted its functionality based on the number of pages for the available jobs
- The model successfully stored over 45,000 job listings on the client's server. This involved implementing an efficient data storage mechanism to ensure the seamless organization and accessibility of the extensive job dataset.
